ABSTRACT

An electronic form system and a method thereof. The method includes receiving a first business electronic form submitted by a user, reading a second business electronic form previously submitted by the user, and determining whether a first business time recorded by the first business electronic form is continuous and a second business time recorded by the second business electronic form and the first business time are at least partially overlapped. The first business electronic form is not stored if the first business time is not continuous and the second business time and the first business time are at least partially overlapped.
